Abstract

We establish new product identities involving the $q$-analogue of the Fibonacci numbers. We show that the identities lead to alternate expressions of generating functions for close-packed dimers on non-orientable surfaces.

The recursion relation

$$F_{n+2} = F_n + F_{n+1}$$

with the initial values $F_0 = F_1 = 1$ produces the well-known Fibonacci (1170-1250) numbers $1, 1, 2, 3, 5, 8, 13, 21, 34, 55, \cdots$. The Fibonacci sequence can be generalized in a number of ways [1, 2]. One generalization is the $q$-analogue of the sequence defined by the recursion relation

$$F_{n+2}(q) = F_n(q) + qF_{n+1}(q),$$

and the initial condition $F_0(q) = 1$ and $F_1(q) = q$. Here $q$ is any real or complex number. This yields the sequence $1, q, q^2 + 1, q^3 + 2q, q^4 + 3q^2 + 1, \cdots$.

It can be readily established that the generating function of $F_n(q)$ is

$$\frac{1}{1 - qs - s^2} = \sum_{n=0}^{\infty} F_n(q)s^n.$$  \(3\)

Writing $q = x - x^{-1}$ and partial fractioning the left-hand side of (3), one obtains the explicit expression

$$F_n(q) = \frac{x^{n+1} + (-1)^n x^{-(n+1)}}{x + x^{-1}}, \quad n = 0, 1, 2, \cdots.$$  \(4\)

We have following identities which we state as a theorem.

Theorem: (A) For $M = \text{integers}$ and $\theta_m = m\pi/(2M + 1)$, we have

$$\mathcal{F}_M(q) \pm i \mathcal{F}_{M-1}(q) = \prod_{m=1}^{M} \left( q \mp 2i (-1)^m \cos \theta_m \right), \quad M = 1, 2, \cdots.$$  \(5\)

(B) For $M = \text{integers}$ we have

$$\mathcal{F}_M(q) = \prod_{m=1}^{M} \left( q + 2i \cos \frac{m\pi}{M + 1} \right), \quad M = 1, 2, \cdots.$$  \(6\)

(C) For $N = \text{integers}$ and $\phi_n = (2n - 1)\pi/2N$, we have

$$\mathcal{F}_N(q) + \mathcal{F}_{N-2}(q) = \prod_{n=1}^{N} \left( q \pm 2i \cos \phi_n \right) \quad N = 2, 4, \cdots$$

$$= \pm 2i + \prod_{n=1}^{N} \left( q \pm 2i(-1)^n \sin \phi_n \right), \quad N = 1, 3, \cdots.$$  \(8\)
(D) For $M = \text{integers}, N = \text{odd}, q_n = 2\tau^{-1}\sin \phi_n, \text{ and } p_m = 2\tau \cos \theta_m,$ we have

$$
\tau^{MN} \prod_{n=1}^{N} \left( F_M(q_n) - i (-1)^{n+M} F_{M-1}(q_n) \right) = i^{-M^2} \prod_{m=1}^{M} \left( F_N(p_m) + F_{N-2}(p_m) + 2i(-1)^{m+M} \right), \quad (9)
$$

These identities can be established by determining the zeroes of the expressions. To establish (A), for example, using (4) it is straightforward to deduce the identity

$$
F_M(q) \pm i F_{M-1}(q) = x^{-M} \left( \frac{x^{2M+1} - (\pm i)^{2M+1}}{x \mp i} \right). \quad (10)
$$

The quantity inside the parentheses in (10) is a polynomial of degree $2M$ in $x$ with the highest term $x^{2M}$. It has $2M$ zeroes at

$$
x_m = \pm i e^{i\theta_{2m}}, \quad m = 1, 2, \ldots, 2M.
$$

Using the fact that $x_{2M} = -x_1^*, x_{2M-1} = -x_2^*, \ldots, x_{M+1} = -x_M^*$, we obtain

$$
F_M(q) \pm i F_{M-1}(q) = x^{-M} \prod_{m=1}^{2M} (x - x_m)
$$

$$
= x^{-M} \prod_{m=1}^{M} (x - x_m)(x + x_m^*)
$$

$$
= \prod_{m=1}^{M} \left( q \mp 2i \cos \theta_{2m} \right). \quad (11)
$$

This leads to (A) after we make use of the identities $\cos \theta_{2M} = -\cos \theta_1, \cos \theta_{2M-2} = (-1)^3 \cos \theta_3, \ldots$. The identity (B) is proved in a similar fashion.

To establish (C) we note that for all $N$ we have

$$
F_N(q) + F_{N-2}(q) = x^N + (-x)^{-N}.
$$

For $N = \text{even}$, the polynomial $x^{-N}(x^{2N} + 1)$ has $2N$ zeroes at

$$
x_n = \mp ie^{i\phi_n}, \quad x_n = \mp ie^{-i\phi_n}, \quad n = 1, 2, \ldots, N. \quad (12)
$$

This leads to (7) by factorizing the polynomial as in the proof of (A).

For $N = \text{odd}$, we have instead

$$
F_N(q) + F_{N-2}(q) \mp 2i = x^N - x^{-N} \mp 2i
$$

$$
= x^{-N} \left( x^N \mp i \right)^2
$$

$$
= x^{-N} \prod_{n=1}^{N} (x - x_n)^2 \quad (13)
$$

where $x_n = \mp(-1)^ne^{i\phi_n}$. The identity (8) now follows the replacement of $x_1 = -x_1^*, x_2 = -x_{N-1}^*, \ldots$ in one of the $x - x_n$ factors.
To establish (D), write \( q = q_n = 2\tau^{-1} \sin \phi_n \) in (A) and \( q = p_m = 2\tau \cos \theta_m \) in (C) to obtain, respectively,

\[
\mathcal{F}_M(q_n) - i(-1)^n M \mathcal{F}_{M-1}(q_n) = \prod_{m=1}^M \left( 2\tau^{-1} \sin \phi_n + 2i(-1)^{n+m+M} \cos \theta_m \right)
\]

\[
\mathcal{F}_N(p_m) + \mathcal{F}_{N-2}(p_m) + 2i(-1)^{n+M} = \prod_{n=1}^N \left( 2\tau \cos \theta_m - 2i(-1)^{n+m+M} \sin \phi_n \right).
\]

The identity (D) now follows by combining these two expressions and the fact that, for \( N = \) odd integers,

\[
\prod_{m=1}^M \prod_{n=1}^N (i(-1)^{m+N+n+1}) = i^M.
\]

The identities (A) - (D) can be used to deduce alternate expressions for dimer generating functions on a Möbius strip. Let \( Z_{M,N}^{\text{Mob}}(z_h, z_v) \) be the generating function on an \( M \times N \) Möbius strip of width \( N \) with horizontal dimer weights \( z_h \) and vertical dimer weights \( z_v \). It can be shown that, by using (A) - (D) and the equivalences of the sets \( \{ \sin \phi_n \} = \{ \cos \phi_n \} \) for \( N = \) even and \( \{ \sin \phi_n \} = \{ (-1)^n \sin \phi_n \} \) with \( n = 1, 2, \ldots, N \), one establishes the following equivalent expressions:

For \( N = \) even and \( \tau = z_v/z_h \),

\[
Z_{2M,N}^{\text{Mob}}(z_h, z_v) = \prod_{m=1}^M \prod_{n=1}^{N/2} \left( 4z_v^2 \sin^2 \phi_{2n} + 4z_v^2 \cos^2 \theta_m \right)
\]

\[
= z_h^{MN} \prod_{m=1}^M \left( \mathcal{F}_N(p_m) + \mathcal{F}_{N-2}(p_m) \right)
\]

\[
= z_v^{MN} \prod_{n=1}^{N/2} \mathcal{F}_{2M}(q_n), \quad N = \text{even}
\]

\[
Z_{2M-1,N}^{\text{Mob}}(z_h, z_v) = 2z_h^{N/2} \prod_{m=1}^{M-1} \prod_{n=1}^{N/2} \left( 4z_h^2 \sin^2 \phi_{2n} + 4z_v^2 \cos^2 (m\pi/2M) \right)
\]

\[
= 2z_h^{(2M-1)N/2} \prod_{m=1}^{M-1} \left[ \mathcal{F}_N \left( 2\tau \cos (m\pi/2M) \right) + \mathcal{F}_{N-2} \left( (2\tau \cos (m\pi/2M)) \right) \right]
\]

\[
= 2z_h^{N/2} z_v^{(M-1)N/2} \prod_{n=1}^{N/2} \left( q_n^{-1} \mathcal{F}_{2M-1}(q_n) \right), \quad N = \text{even}.
\]

For \( N = \) odd and \( \tau = z_v/z_h \),

\[
Z_{2M,N}^{\text{Mob}}(z_h, z_v) = \text{Re} \left[ (1-i) \prod_{m=1}^M \prod_{n=1}^N \left( 2i(-1)^{M+n+1} z_h \sin \phi_{2n} + 2z_v \cos \theta_m \right) \right]
\]

\[
= z_h^{MN} \text{Re} \left[ (1-i) \prod_{m=1}^M \left( \mathcal{F}_N(p_m) + \mathcal{F}_{N-2}(p_m) + 2i(-1)^{m+M} \right) \right]
\]

\[
= z_v^{MN} \text{Re} \left[ (1-i)i^{M^2} \prod_{n=1}^N \left( \mathcal{F}_M(q_n) - i(-1)^{n+M} \mathcal{F}_{M-1}(q_n) \right) \right], \quad N = \text{odd}.
\]

Expressions (14), (17) and (20) are those given by Lu and Wu \([3, 4]\), expressions (15), (18) and (21) are given by Tesler \([5]\), and expressions (16), (19) and (22) are new.
